9 **8 issues with duplicate title tags**8 

About this issue: Our crawler reports pages that have duplicate title tags only if they are exact matches. Duplicate <title> tags make it difficult for search engines to determine which of a website's pages is relevant for a specific search query, and which one should be prioritized in search results. Pages with duplicate titles have a lower chance of ranking well and are at risk of being banned.

Moreover, identical <title> tags confuse users as to which webpage they should follow. How to fix: Provide a unique and concise title for each of your pages that contains your most important keywords. For information on how to create effective titles, please see this Google article: <https://support.google.com/webmasters/answer/35624>.

1 page returned a 4XX status code1 

About this issue: A 4xx error means that a webpage cannot be accessed. This is usually the result of broken links. These errors prevent users and search engine robots from accessing your webpages, and can negatively affect both user experience and search engine crawlability. This will in turn lead to a drop in traffic driven to your website. Please be aware that crawler may detect a working link as broken if your website blocks our crawler from accessing it. This usually happens due to the following reasons: 1.

DDoS protection system. 2. Overloaded or misconfigured server.

How to fix: If a webpage returns an error, remove all links leading to the error page or replace it with another resource. To identify all pages on your website that contain links to a 4xx page, click "View broken links" next to the error page. If the links reported as 4xx do work when accessed with a browser, you can try either of the following: 1.

Contact your web hosting support team. 2. Instruct search engine robots not to crawl your website too frequently by specifying the "crawl-delay" directive in your robots.txt.

0 pages returned 5XX status code

0 

0 pages don't have title tags

0 

0 pages have duplicate content issues

0 

0 internal links are broken

0

0 links couldn't be crawled (incorrect URL formats)	0
0 structured data items are invalid	0
0 pages are missing the viewport width value	0
0 pages have slow load speed	0

65 ⁰

25 images don't have alt attributes

About this issue: Alt attributes within tags are used by search engines to understand the contents of your images. If you neglect alt attributes, you may miss the chance to get a better placement in search results because alt attributes allow you to rank in image search results. Not using alt attributes also negatively affects the experience of visually impaired users and those who have disabled images in their browsers.

For more information, please see these articles: Using ALT attributes smartly:

<https://webmasters.googleblog.com/2007/12/using-alt-attributes-smartly.html> and Google Image Publishing Guidelines: <https://support.google.com/webmasters/answer/114016?hl=en>.

How to fix: Specify a relevant alternative attribute inside an tag for each image on your website, e.g., "".

25 ⁰

8 pages don't have meta descriptions

About this issue: Though meta descriptions don't have a direct influence on rankings, they are used by search engines to display your page's description in search results. A good description helps users know what your page is about and encourages them to click on it. If your page's meta description tag is missing, search engines will usually display its first sentence, which may be irrelevant and unappealing to users.

For more information, please see these article: Create good titles and snippets in Search Results:

<https://support.google.com/webmasters/answer/35624>. How to fix: In order to gain a higher click-through rate, you should ensure that all of your webpages have meta descriptions that contain relevant keywords.

8 ⁰

8 pages have low text-HTML ratio

About this issue: Your text to HTML ratio indicates the amount of actual text you have on your webpage compared to the amount of code. This issue is triggered when your text to HTML is 10% or less. Search engines have begun focusing on pages that contain more content.

That's why a higher text to HTML ratio means your page has a better chance of getting a good position in search results. Less code increases your page's load speed and also helps your rankings. It also helps search engine robots crawl your website faster.

How to fix: Split your webpage's text content and code into separate files and compare their size. If the size of your code file exceeds the size of the text file, review your page's HTML code and consider optimizing its structure and removing embedded scripts and styles.

8 ⁰

8 issues with uncompressed JavaScript and CSS files

About this issue: This issue is triggered if compression is not enabled in the HTTP response.

Compressing JavaScript and CSS files significantly reduces their size as well as the overall size of your webpage, thus improving your page load time. Uncompressed JavaScript and CSS files make your page load slower, which negatively affects user experience and may worsen your search engine rankings.

If your webpage uses uncompressed CSS and JS files that are hosted on an external site, you should make sure they do not affect your page's load time. For more information, please see this Google article <https://developers.google.com/web/fundamentals/performance/optimizing-content-efficiency>. How to fix: Enable compression for your JavaScript and CSS files on your server.

If your webpage uses uncompressed CSS and JS files that are hosted on an external site, contact the website owner and ask them to enable compression on their server. If this issue doesn't affect your page load time, simply ignore it.

8 ⁰

8 issues with uncached JavaScript and CSS files

8 0

About this issue: This issue is triggered if browser caching is not specified in the response header. Enabling browser caching for JavaScript and CSS files allows browsers to store and reuse these resources without having to download them again when requesting your page. That way the browser will download less data, which will decrease your page load time.

And the less time it takes to load your page, the happier your visitors are. For more information, please see this Google article

<https://developers.google.com/web/fundamentals/performance/optimizing-content-efficiency>.

How to fix: If JavaScript and CSS files are hosted on your website, enable browser caching for them.

If JavaScript and CSS files are hosted on a website that you don't own, contact the website owner and ask them to enable browser caching for them. If this issue doesn't affect your page load time, simply ignore it.

6 pages have a low word count

6 0

About this issue: This issue is triggered if the number of words on your webpage is less than 200. The amount of text placed on your webpage is a quality signal to search engines. Search engines prefer to provide as much information to users as possible, so pages with longer content tend to be placed higher in search results, as opposed to those with lower word counts.

For more information, please view this video: <https://www.youtube.com/watch?v=w3-obcXkyA4>.

How to fix: Improve your on-page content and be sure to include more than 200 meaningful words.

Sitemap.xml not indicated in robots.txt

1 0

About this issue: If you have both a sitemap.xml and a robots.txt file on your website, it is a good practice to place a link to your sitemap.xml in your robots.txt, which will allow search engines to better understand what content they should crawl. How to fix: Specify the location of your sitemap.xml in your robots.txt. To check if Googlebot can index your sitemap.xml file, use the Sitemaps report in Google Search Console: https://search.google.com/search-console/not-verified?original_url=/search-console/sitemaps&original_resource_id.

Sitemap.xml not found

1 0

About this issue: A sitemap.xml file is used to list all URLs available for crawling. It can also include additional data about each URL. Using a sitemap.xml file is quite beneficial.

Not only does it provide easier navigation and better visibility to search engines, it also quickly informs search engines about any new or updated content on your website. Therefore, your website will be crawled faster and more intelligently. How to fix: Consider generating a sitemap.xml file if you don't already have one.

Then you should specify the location of your sitemap.xml files in your robots.txt, and check if Googlebot can index your sitemap.xml file with the Sitemaps report in Google Search Console:

https://search.google.com/search-console/not-verified?original_url=/search-console/sitemaps&original_resource_id.

0 external links are broken

0 0

0 external images are broken

0 0

0 links on HTTPS pages leads to HTTP page

0 0

0 HTTP URLs in sitemap.xml for HTTPS site

0 0

0 uncompressed pages

0 0

0 issues with blocked internal resources in robots.txt

0 0

0 pages have a JavaScript and CSS total size that is too large

0 0

0 pages use too many JavaScript and CSS files

0 0

0 issues with unminified JavaScript and CSS files

0 0

0 link URLs are too long

0 0

6 **3 subdomains don't support HSTS**3 **2 issues with blocked external resources in robots.txt**2 

About this issue: Blocked external resources are resources (e.g., CSS, JavaScript, image files, etc.) that are hosted on an external website and blocked from crawling by a "Disallow" directive in an external robots.txt file. Disallowing these files may prevent search engines from accessing them and, as a result, properly rendering and indexing your webpages. This, in return, may lead to lower rankings.

For more information, please see this article

<https://support.google.com/webmasters/answer/6153277?hl=en>. How to fix: If blocked resources that are hosted on an external website have a strong impact on your website, contact the website owner and ask them to edit their robots.txt file. If blocked resources are not necessary for your site, simply ignore them.

1 page has only one incoming internal link1 

About this issue: Having very few incoming internal links means very few visits, or even none, and fewer chances of placing in search results. It is a good practice to add more incoming internal links to pages with useful content. That way, you can rest assured that users and search engines will never miss them.

How to fix: Add more incoming internal links to pages with important content.

0 pages have more than one H1 tag

0 

0 pages are blocked from crawling

0 

0 page URLs are longer than 200 characters

0 

0 outgoing external links contain nofollow attributes

0 

Robots.txt not found

0 

0 pages have hreflang language mismatch issues

0 

0 orphaned pages in Google Analytics

0 

0 orphaned pages in sitemaps

0 

0 pages take more than 1 second to become interactive

0 0

0 pages blocked by X-Robots-Tag: noindex HTTP header

0 0

0 issues with broken external JavaScript and CSS files

0 0

0 pages need more than 3 clicks to be reached

0 0

0 URLs with a permanent redirect

Missing meta description

- i** *About this issue: Though meta descriptions don't have a direct influence on rankings, they are used by search engines to display your page's description in search results. A good description helps users know what your page is about and encourages them to click on it. If your page's meta description tag is missing, search engines will usually display its first sentence, which may be irrelevant and unappealing to users. For more information, please see these article: Create good titles and snippets in Search Results: <https://support.google.com/webmasters/answer/35624>. How to fix: In order to gain a higher click-through rate, you should ensure that all of your webpages have meta descriptions that contain relevant keywords.*

Low text to HTML ratio

- i** *About this issue: Your text to HTML ratio indicates the amount of actual text you have on your webpage compared to the amount of code. This issue is triggered when your text to HTML is 10% or less. Search engines have begun focusing on pages that contain more content. That's why a higher text to HTML ratio means your page has a better chance of getting a good position in search results. Less code increases your page's load speed and also helps your rankings. It also helps search engine robots crawl your website faster. How to fix: Split your webpage's text content and code into separate files and compare their size. If the size of your code file exceeds the size of the text file, review your page's HTML code and consider optimizing its structure and removing embedded scripts and styles.*

Low word count

- i** *About this issue: This issue is triggered if the number of words on your webpage is less than 200. The amount of text placed on your webpage is a quality signal to search engines. Search engines prefer to provide as much information to users as possible, so pages with longer content tend to be placed higher in search results, as opposed to those with lower word counts. For more information, please view this video: <https://www.youtube.com/watch?v=w3-obcXkyA4>. How to fix: Improve your on-page content and be sure to include more than 200 meaningful words.*

Sitemap.xml not specified in robots.txt

- i **About this issue:** If you have both a `sitemap.xml` and a `robots.txt` file on your website, it is a good practice to place a link to your `sitemap.xml` in your `robots.txt`, which will allow search engines to better understand what content they should crawl. How to fix: Specify the location of your `sitemap.xml` in your `robots.txt`. To check if Googlebot can index your `sitemap.xml` file, use the Sitemaps report in Google Search Console: https://search.google.com/search-console/not-verified?original_url=/search-console/sitemaps&original_resource_id

Sitemap.xml not found

i *About this issue: A sitemap.xml file is used to list all URLs available for crawling. It can also include additional data about each URL. Using a sitemap.xml file is quite beneficial. Not only does it provide easier navigation and better visibility to search engines, it also quickly informs search engines about any new or updated content on your website. Therefore, your website will be crawled faster and more intelligently. How to fix: Consider generating a sitemap.xml file if you don't already have one. Then you should specify the location of your sitemap.xml files in your robots.txt, and check if Googlebot can index your sitemap.xml file with the Sitemaps report in Google Search Console: https://search.google.com/search-console/not-verified?original_url=/search-console/sitemaps&original_resource_id*

No HSTS support

- i** About this issue: HTTP Strict Transport Security (HSTS) informs web browsers that they can communicate with servers only through HTTPS connections. So, to ensure that you don't serve unsecured content to your audience, we recommend that you implement HSTS support. How to fix: Use a server that supports HSTS.

Blocked external resources in robots.txt

- i** About this issue: Blocked external resources are resources (e.g., CSS, JavaScript, image files, etc.) that are hosted on an external website and blocked from crawling by a "Disallow" directive in an external robots.txt file. Disallowing these files may prevent search engines from accessing them and, as a result, properly rendering and indexing your webpages. This, in return, may lead to lower rankings. For more information, please see this article <https://support.google.com/webmasters/answer/6153277?hl=en>. How to fix: If blocked resources that are hosted on an external website have a strong impact on your website, contact the website owner and ask them to edit their robots.txt file. If blocked resources are not necessary for your site, simply ignore them.

Pages with only one internal link

i About this issue: Having very few incoming internal links means very few visits, or even none, and fewer chances of placing in search results. It is a good practice to add more incoming internal links to pages with useful content. That way, you can rest assured that users and search engines will never miss them. How to fix: Add more incoming internal links to pages with important content.
